Filter Selection Guide

Dräger. Technology for Life®

This brochure will give you a brief overview of the most important factors to consider when choosing filtering respiratory protection devices. This information can help you protect yourself against harmful substances in the air by selecting the appropriate masks and filters.

1. What must I consider when choosing a respirator?

The hazards in your environment must be known, as well as the work requirements and the external conditions. Additionally you must take into consideration the protection level required by your respirator – as well as the type and protection level of the necessary filter.

2. Please check the following before using filtering respiratory protection:

- Is there enough oxygen in the ambient air? (see your local legislative requirements – in Germany a minimum of 17 vol. % is required)
- What contaminants are in the ambient air?
- What are the concentrations of the contaminants?
- Are the contaminants in gas, particle, or vapour form? Or are they a mixture?
- Do the contaminants have adequate warning properties (e.g. smell or taste?)
- What are the applicable Occupational Exposure Limits (OEL)?
- In addition to respiratory protection, is other personal protection equipment (e.g. eye or ear protection) required?

3. Which respirator should I choose?

It is necessary to answer all of the above questions (in 2.) to determine the needed protection factor. Table 1 gives you a brief overview of the nominal protection factors (NFP) for respiratory protective devices. The NFP is the highest permissible leakage level according to the approval requirements of the respective device. It indicates the mathmetically calculated maximum protection performance. To evaluate the minimum required protection factor – you will need to know the concentration of the hazardous substance you are dealing with as well as the assigned Occupational Exposure Limit (OEL) of the substance. An OEL (like AGW) is the concentration of a specific airborne substance – averaged over a reference period, which shows no evidence to be threatening to ones health if exposed to it, at that concentration, on a daily basis.

Device	Marking	Nominal
	-	protection
		factor 1)
Particle filtering devices		
Filtering facepiece	FFP1	4
	FFP2	12
	FFP3	50
Quarter / Half mask	P1	4
with filter	P2	12
	P3	48
Full face mask	P1	5
with filter	P2	16
	P3	1000
PAPR	TH1P	10
with helmet or hood	TH2P	50
	ТНЗР	500
PAPR with quarter /	TM1P	20
half or full face mask	TM2P	200
(power on)	ТМЗР	2000

Table 1: List of respiratory protective devices

Gas filtering devices

Quarter / half mask with filter	50
Full face mask with filter	2000

 Values have been taken from the EN 529:2005 and BGR 190. Additional national and local regulations must be followed. Keep in mind that the performance indicated by the nominal protection factor can only be achieved when the respiratory protective device is worn correctly and has been properly maintained. Make sure you choose the size that fits best for your face. Also, a respirator should only be worn on cleanly shaven faces, as facial hair in the sealing area causes leakage.

Example: Determining the needed protection factor of your respirator

Contaminant:	Lead dust (particle
	protection is needed)
Concentration at the work place:	3 mg/m ³
OEL (Occupational Exposure Limit):	0.1 mg/m ³
Minimum protection factor =	
concentration of hazardo	$\frac{\text{us substance}}{1} = \frac{3}{0.1} = 30$
OEL	$= \frac{1}{0.1} = 30$

You can see in table 1 that with a needed minimum protection factor of 30 for lead dust, you will need to use a P3-filter or together with a half mask, a full face mask, or PAPR. In the case where the contaminants are present in both particle and gas form, the nominal protection factor must be established for each one separately. For the selection of filtering devices, the higher protection factor must be applied. The concentration of gases is measured in ppm (parts per million= volume of the substance within 1 m³ of air) or mg/m³ (= weight of the substance within 1 m³ of air) and the concentration of particles (dust) only in mg/m³. While mg/m³ deals with weight and ppm with volume, there is no direct calculation for mg/m³ to ppm. Higher concentrations are often indicated in % by volume, 10,000 ppm = 1 vol. %.

4. What is the maximum concentration of the contaminant for which I can use respiratory protection? You can determine the maximum permissible concentration by multiplying the nominal protection factor (as found in table 1) by the Occupational Exposure Limit (OEL).

Maximum permissible concentration =			
	nominal protection factor x OEL		
Example: Deter	mining the maximum permissible concentration ²⁾		
Contaminant: OEL: Respirator:	Chlorine dioxide 0.1 ppm (Occupational Exposure Limit) Full face mask with combination filter B-P2		
Nominal protec	tion factor x OEL = Maximum permissible concentration		
Nominal protection factor of full face mask with gas filter: 2000 2000 x 0.1 = 200 ppm Chlorine dioxide			
Nominal protection factor of full face mask with particle filter P2: 16 16 x 0.1 = 1.6 ppm Chlorine dioxide			
When using a combination filter, which is the case in the above illustration, both of the maximum permissible concentrations need to be calculated, i.e. the value for the gas filter and the value for the particle filter. The lower of the two values should be taken as the maximum permissible concentration for this combination filter.			

For the example above therefore, the maximum permissible concentration for chorine dioxide when using a full face mask with a B-P2 combination filter is 1.6 ppm of Chlorine Dioxide

²¹ Values and terms of calculation have been taken from the EN529:2005 and BGR 190. Additional national and local regulations must be followed. Values of OEL based on AGW according to German regulations and there of time-weighted average values over a reference period and not any short term exposure limits.

5. How to select the right filter?

Contaminants come in different forms – generally: aerosols (solids/particles) and gases (gases, vapours). You can choose between the filter types to protect against one of these forms or a combination of both of them.

Solids / particles:	Dusts, fibres, fumes,
	microorganisms
	(e.g. viruses, bacteria,
	fungi, spores) and mists
Gaseous substances:	Gases and vapours

The following table shows you the color coding of filters according to EN14387 – which helps you to determine which filter-type is needed for the contaminants you are dealing with.

Colour	Filter	Contaminants present
code	type	
	AX ³⁾	Gases and vapours of organic
		compounds with boiling point \leq 65 °C
	А	Gases and vapours of organic
		compounds with boiling point > 65 °C
	В	Inorganic gases and vapours,
		e.g. chlorine, hydrogen sulphide,
		hydrogen cyanide
	E	Sulphur dioxide, hydrogen chloride
	К	Ammonia and organic
		Ammonia derivates
	CO ⁴⁾	Carbon monoxide
	Hg⁵)	Mercury vapour
	NO ⁶⁾	Nitrous gases
		including nitrogen monoxide
	Reactor ⁷⁾	Radioactive iodine
		including radioactive methyl iodide
	Р	Particles

Table 2: Colour-Coding for Filters

³⁾ AX filters may only be used as supplied from factory. Reuse and use against gascompounds is absolutely impermissible.

⁴⁾ CO filters for one time use only. Must be disposed after use. Special guidelines according to local regulations apply.

⁵⁾ Hg Filters can only be used for a maximum of 50 hours according to EN 14387.

⁶⁾ NO filters for one time use only. Must be disposed after use.

7) Reactor filters: special guidelines according to local regulations apply.

Differentiation of filter types

Filters are split in different classes according to their capacity (gas filters) or their efficiency (particle filters), see table 3. Gas filters of class 2 may be used at higher concentrations or for a longer time than class 1 filters. The class of a particle filter indicates how efficient the filter is in filtering out particles. (class 1: 80%, class 2: 94%, class 3: 99.95%).

Filter type	Filter class	Protection against	Maximum permissible concentration of toxic substance		
Gas filter		Gases and vapours			
		Capacity:	50 times the OEL with half masks / 2000 times the OEL with full face masks, but maximal:		
	1	Small	0.1 vol. % (1000 ppm) ⁸⁾		
	2	Medium	0.5 vol. % (5000 ppm) ⁸⁾		
	3	Large	1.0 vol. % (10000 ppm) ⁸⁾		
Particle filter		Particles Efficiency (separation ability):			
	1	Small	4 times the OEL with half masks / 5 times the OEL with full face masks ⁹⁾		
	2	Medium	12 times the OEL with half masks / 16 times the OEL with full face masks ⁹⁾		
	3	Large	48 times the OEL with half masks / 1000 times the OEL with full face masks ⁹⁾		
Combined filter Gase		Gases, vapours	and particles		
	2-P2 1-P3	Appropriate combination of gas and particle filters	Appropriate combined levels		

Table 3: Differentiation of filter types

⁸⁾ Values taken from the European Norm EN 14387
⁹⁾ Values taken from the BGR 190

Additional national and local regulations must be followed.

Example Filter Types:

A2B2-P3

A filter with the above mentioned colour code is suitable for the following contaminants:

- A gases and vapours of organic compounds with a boiling point beyond 65 °C up to concentrations covered by filter class 2 and
- **B** inorganic gases and vapours, e.g. chlorine, hydrogen sulphide, hydrogen cyanide, up to concentrations covered by filter class 2 and
- P particles up to concentrations covered by filter class 3.

6. When using filtering respiratory protection, always keep the following in mind:

Never use any kind of filtering respiratory protection device . . .

- in oxygen deficient atmospheres (see local legislation for further guidelines e.g. Germany less than 17 vol. % O₂)
- in poorly ventilated areas or confined spaces, such as tanks, small rooms, tunnels, or vessels
- in atmospheres where the concentrations of the toxic contaminants are unknown
- when the concentration of a contaminant is higher than the maximum permissible concentration and / or the filter class capacity
- when the contaminant has poor or no warning properties (smell, taste or irritation), such as aniline, benzene, carbon monoxide, and ozone

Immediately leave the area if . . .

- · breathing resistance increases noticeably
- you began to feel dizzy
- you smell, taste, or become irritated by the contaminant
- your respirator is damaged

Make sure that . . .

- the selected respirator fits properly
- if both gases and particles are present, that you use a combination filter, to filter out both gases and particles

7. How long does a filter last?

The service life of a respiratory filter depends on its size and on the conditions of use.

Factors affecting service life:

- · concentration of the contaminants
- combination of the contaminants
- · air humidity
- temperature
- duration of use
- · breathing rate of the user

Since the service life is influenced by many factors, it is not possible to give an estimated service life. Important is:

· local / company regulations

The end of service life is generally recognizable by:

- in gas filters by a noticeable taste or smell of the contaminant
- in particle filters by an increased breathing resistance
- in combination filters a noticeable taste or smell and/or an increased breathing resistance

Table 4: Examples of contaminants, their OELs (here: AGWs, valid in Germany) and filter recommendations

This is only a small choice of contaminants as example. For more information and a wider choice of contaminants please try our Dräger VOICE database of hazardous substances on the internet (www.draeger.com/voice).

Indication E: with reference to the inhalable fraction

Indication A: with reference to the alveolar fraction

¹¹ A gas filter is required; if the contaminant is particulate or if particles are present, a combination filter is required, e.g. formaldehyde: B2 (P3).

¹²⁾ A combination filter is required, e.g. lindane: A-P.

No responsibility is taken for the correctness of this information.

A wider choice of contaminants is offered by our **Dräger VOICE 5.0** database of hazardous substances. With Dräger VOICE, you have the unique option to search for approx. 1,750 contaminants and their chemical properties in a compact database.

The special features of Dräger VOICE:

In addition to information about and properties of the substance you receive further recommendations for suitable products to measure these contaminants (from a simple single gas measuring instrument to mobile multiple gas measuring instruments or stationary gas measuring technology) and for options to protect effectively against these substances.

Important information and notes on the handling and use of the recommended products are, of course, also included, such as instructions for use, further product information and related products. If a substance searched for cannot be found or you have special queries, you can contact our experts by email with a single click for further help.

More than 30,000 users globally already use the contaminant database Dräger VOICE – some of them every day. Test Dräger VOICE yourself and utilise the information to make your workplace safer!

www.draeger.com/voice

Additional support is offered by the **Dräger APR Online Training.**

Whether you are a safety engineer, company safety officer, master craftsman or a distributor of safety products:

Our training platform supports and guides you through numerous issues surrounding respiratory protection. Topics covered, range from identifying hazards to proper selection and use of respiratory protection up to establishing a respiratory protection programme in your company.

Along the way you will also discover a number of topics to help you provide professional employee/customer care on all matters relating to respiratory protection.

Our "Dr. X-Pert" will support you during your tour through this training platform and will provide you with useful hints.

You can find the **APR Online Training** in the internet under **www.draeger.com/apr-training**
